EDUCATION

- **Georgia Institute of Technology** Atlanta, GA
Master of Science in Computer Science, Concentration in Computing Systems May 2026
- **The University of Texas at Austin** Austin, TX
Bachelor of Science in Mechanical Engineering, Minors in CS and Business May 2023

EXPERIENCE

- **AT&T** Dallas, TX
Lead Data/AI Engineer, Finance Jul 2026 – Present
 - Implementing generative AI solutions across the Financial Technology organization by designing APIs to give analysts faster access to financial data, reduce repetitive data requests, and reduce the workload of data engineers.
 - Building a text-to-SQL chatbot used by financial analysts to examine trends in data for new mobility and broadband accounts. The chatbot features a Streamlit app that replaces legacy OLAP cubes.
 - Deployed a locally hosted MCP server for data engineers to automate data requests, including tools for querying MSSQL databases and instructions for handling business logic in internal credit systems.
- *Senior Data/AI Engineer, Finance* Jul 2025 – Jun 2026
 - Developed Databricks SQL and PySpark pipelines to ingest, transform, and analyze Credit and Collections data for new mobility accounts, identifying accounts at risk for fraud, disconnects, and suspensions.
 - Refactored legacy batch processes and migrated scheduled jobs from a Windows VM to Databricks using PySpark, adding structured logging and error handling to cut downtime and eliminate single-host failure points.
 - Established the team's first GitHub-based development workflow and CI/CD foundation, migrating a 30-member team from network drives and ad hoc releases while defining Git workflows and code review standards across the org.
- *Data/AI Engineer II, Chief Data Office* Jan 2024 – Jun 2025
 - Delivered FastAPI services on Azure App Services to orchestrate multi-agent workflows across 10+ business domains, using LangChain and LangGraph for agent logic, tool calling, and decision handling.
 - Hardened codebase security with Azure Key Vault and MSAL-backed secret loading. Created a CLI that handles OAuth2 device-code authentication so developers and agents could authenticate against internal APIs.
 - Designed a LangGraph-based file summarization app adopted by Legal, Real Estate, and other domains.
- *Data/AI Engineer I, Field Operations* Jul 2023 – Dec 2023
 - Oversaw the Operations Team's migration from MySQL to Snowflake. Used Palantir Foundry and PySpark to construct pipelines for over 20 datasets, refined over 30 million rows of data, and set up automated refreshes.
 - Designed a 20-page Power BI report covering project management and financial views. The report pulls and transforms data from Palantir, Jira, and SharePoint.

PROJECTS

- **Syllabus Helper**
LangGraph, FastAPI, Streamlit, RAG January 2026
 - Built a RAG-based chatbot enabling OMSCS students to query course syllabi, calculate grades, and auto-schedule key dates via the Google Calendar API, reducing manual academic planning effort.
 - Ingested all OMSCS syllabi from Georgia Tech's official website into a LangChain in-memory vector store, enabling semantic search across required and elective course content.
 - Built with LangGraph for multi-step reasoning, FastAPI for backend services, and Streamlit for the UI. Combined prompt chaining and retrieval-augmented generation to deliver accurate, context-aware responses grounded in syllabus content.

SKILLS

- **Programming Languages:** Python, SQL, R, Java, JavaScript, TypeScript, HTML, CSS
- **Libraries & Frameworks:** PySpark, FastAPI, LangChain, LangGraph, Pydantic AI, FastMCP, Streamlit
- **Tools & Platforms:** Git, Docker, Azure, Snowflake, Databricks, Power BI, Jira, Palantir Foundry
- **AI Tools:** Claude Code, Cursor, OpenCode, GitHub Copilot
